On my previous website, I found that its navigation bar had a lot of content and was quite confusing. For example, Syllabus, Course website and Discussion board appear repeatedly in it. Therefore, I removed these redundant modules and presented them one by one in the navigation bar so that student users will not be confused when reading. I also found that some hyperlinks on the previous website did not appear in the new tab page, but replaced the original tab page. I also optimized these hyperlinks to make the user operation smoother. In addition, the original website did not have a footer, so I added a footer.

The challenges I encountered were: I tried many methods but could not make the footer appear only when the user scrolls to the bottom. Later, I referred to other similar websites and looked at the code to find the solution.
